

5.13 VIEWING SERVER ERRORS

Unexpected failures and errors, which might occur while using the software (e.g. the communication was interrupted), are collected in a file. If you receive a message about a server error, inform IZUM, who will recover the error on the basis of its description.

Procedure

1. Select the **System / Server / Show server errors** method.

A window containing a list of server errors will open.

You can see the details of every server error, if you click on it to highlight it, and then click the **Details** button.

The **Error** window will open with the error description. If the list contains more than one server error, move to the next error by clicking the **Next** button. To see the previous error, click the **Previous** button. To close the window, click the **OK** button.

2. Click the **Cancel** button.
