COBISS3 software
Version V6.4-00, December 2015

Description of new features in the COBISS3/Basic Guidelines software module

The following update was added to version 6.4-00 of the COBISS3 software:

1. Search window

The positions of the individual elements in the search window were changed, and the button for searching bibliographic records in the local database was renamed. The search window was updated with a button for selecting the search mode (advanced search, expert search), a button for choosing between operators EMPTY, NOT or NOTEMPTY, a drop-down list for choosing between operators AND or OR and a field for sorting search results by the selected attribute.

In the search window, advanced search mode is set as default. The search window of some classes has the **Expert search** button, used to switch to searching with search prefixes and suffixes as well as logical and context operators. The fields Limiting and Scanning, which can be used to further limit the search, are now located separately from the other search fields.

In search windows of some classes the button for displaying next 10 hits is removed.
