

COBISS3 Software Version V6.3-00, June 2015

Description of new features in the COBISS3/Serials software module

In the COBISS3/Serials software module, Version 6.3-00, the following feature has been included:

1. Sorting item templates

You can sort item templates that are used when editing items in an acquisition document. By using an item template, data on the apportionment of copies and funds is transferred to the item in the acquisition document. You can sort items by highlighting the **Item template** class and selecting the **Class / Sort item templates** method. A window will open, where you can select an individual item and move it up or down.

Users can set up their own individual order of item templates.
